

ABSTRACT OF THE DISCLOSURE

A saw head (2) in an oscillating saw is tiltable in relation to a bottom plate (1), at which a rotatable disk (3) with a clamping device (20, 21, 22) for the workpiece W is arranged. To reach a favorable position of a saw tool (10) of the saw head (2) in relation to a workpiece W during the operation, the saw head (2) is linearly and horizontally displaceable at the bottom plate (1) such
5 that the distance between the chucked workpiece W and the saw tool (10) is minimal.
